Database Systems Engineering and Distributed Backend Development (25CS1302E) | KLH Bachupally Campus | PBL 2026-27

Abstract

- A centralized web platform for students, faculty and staff to report, search, track and recover lost and found campus belongings.
- HTML5/CSS3/JavaScript frontend with Node.js REST APIs and MongoDB backend.
- Outcome:** faster, searchable and location-aware recovery with automated match suggestions and admin verification.

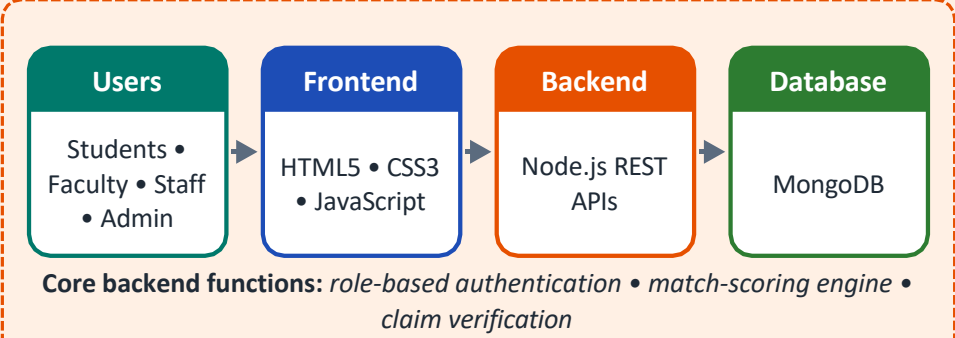

Tools & Technologies

- Front-End:** HTML5 · CSS3 · JavaScript
- Back-End:** Node.js REST APIs
- Database:** MongoDB
- Development:** Visual Studio Code · Git
- Browser:** Chrome / Firefox / Edge

Problem Statement & Objectives

- Problem:** Campus lost-and-found handling is manual, decentralized and lacks location context or verification.
- Objective 1:** Provide one centralized platform for reporting lost and found items.
- Objective 2:** Enable location-based tracking with an interactive campus map.
- Objective 3:** Automatically suggest matches using category, description, date and location.
- Scope:** Campus students, faculty and staff; reporting, search/filter, map tracking, claims and admin verification.

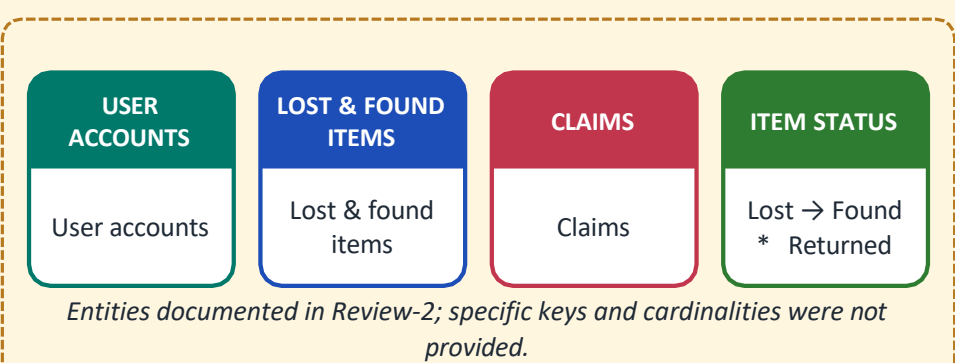

System Architecture

Existing vs Proposed System

Feature	Existing System	Proposed System
[Feature 1]	Notice boards and word of mouth++	Centralized web platform for reporting and searching items
[Feature 2]	Physical registers and scattered social media groups	Search and filter with an interactive campus map
[Feature 3]	Manual searching and matching of lost items	Automatic matching based on category, description, date and location
[Feature 4]	No proper location tracking or claim verification	Admin-side claim verification and status tracking
[Limitation / Gap]	scattered and difficult to search.	Web platform

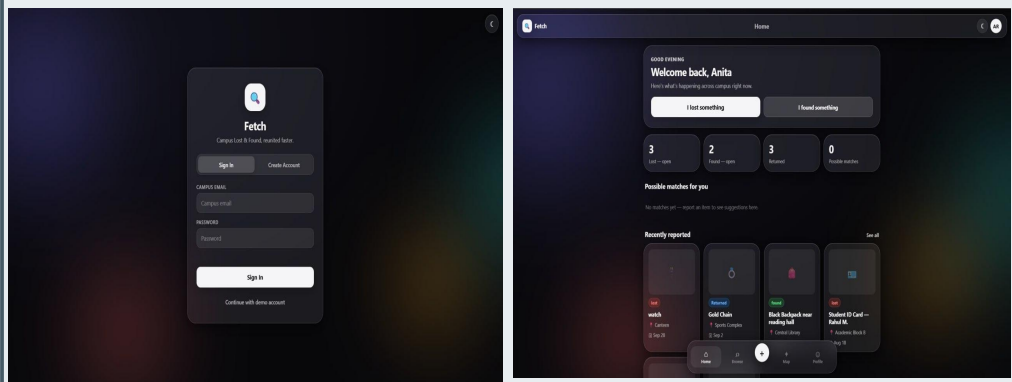

ER Diagram & Database Design

Feasibility Study

- Technical:** HTML5, CSS3, JavaScript, Node.js and MongoDB; modern browser and standard web-server/hosting environment.
- Economic:** Uses the stated web technologies and open-source development tools.
- Operational:** Designed for campus-wide use with role-based access, searchable reports and admin verification.
- Schedule:** Intended for completion within the semester project timeline.

Implementation Screenshots

Results & Testing

- Centralized searchable platform replaces notice boards/scattered groups.
- Location-tagged reports improve tracking through the campus map.
- Match suggestions use category, description, date and location.
- Admin verification supports secure handover.
- Review-2 does not provide numeric performance/CRUD test results.

Conclusion

- The tracker combines reporting, interactive campus mapping, automated matching and admin oversight.
- It addresses the stated manual/decentralized process and supports centralized recovery workflows.

Future Scope

- Real-time push/email alerts
- Native Android/iOS app
- QR-code tagging
- ID-card integration
- AI image matching
